

Getting better. Everyday.

ARYS™ pro

We empower rehabilitation.

ARYS™ pro

ARYS™ pro offers an innovative therapy system for the treatment of arm and hand function due to hemiparesis after a stroke or traumatic brain injury. The system impresses through sophisticated impulses for an active, motivating self-training of the patient. Seamlessly integrating therapy units into patient's everyday life with individually adjustable training repetitions can promote significant progress in motor skills. The device allows the patient to actively execute and enhance even minimal arm movements on a regular basis.

ARYS™ pro has been developed in close collaboration with leading neurologists and therapists in the field of neurorehabilitation.

The clinic system **ARYS™ pro** is based on recording arm motion via two wrist-worn trackers – one recording movements of the healthy arm, the other of the impaired arm – and an innovative evaluation software solution running on an iPad Pro tablet. Those movement records of the healthy and the affected arm allow for meaningful data analysis in order to optimize therapy. For healthcare professionals and therapists the evaluation software offers objective, evidence-based documentation for themselves but also for healthcare insurances. In order to make therapy achievements visible, the therapy progress is recorded in a clear and easily understandable way which allows for a more motivating communication between patient and healthcare professional.
